# Carbo-loading: a relational database

Carbo-Loading represents household level transactions over a period of two years from four categories: Pasta, Pasta Sauce, Syrup, and Pancake Mix. These categories were chosen so that interactions between the categories can be detected and studied.

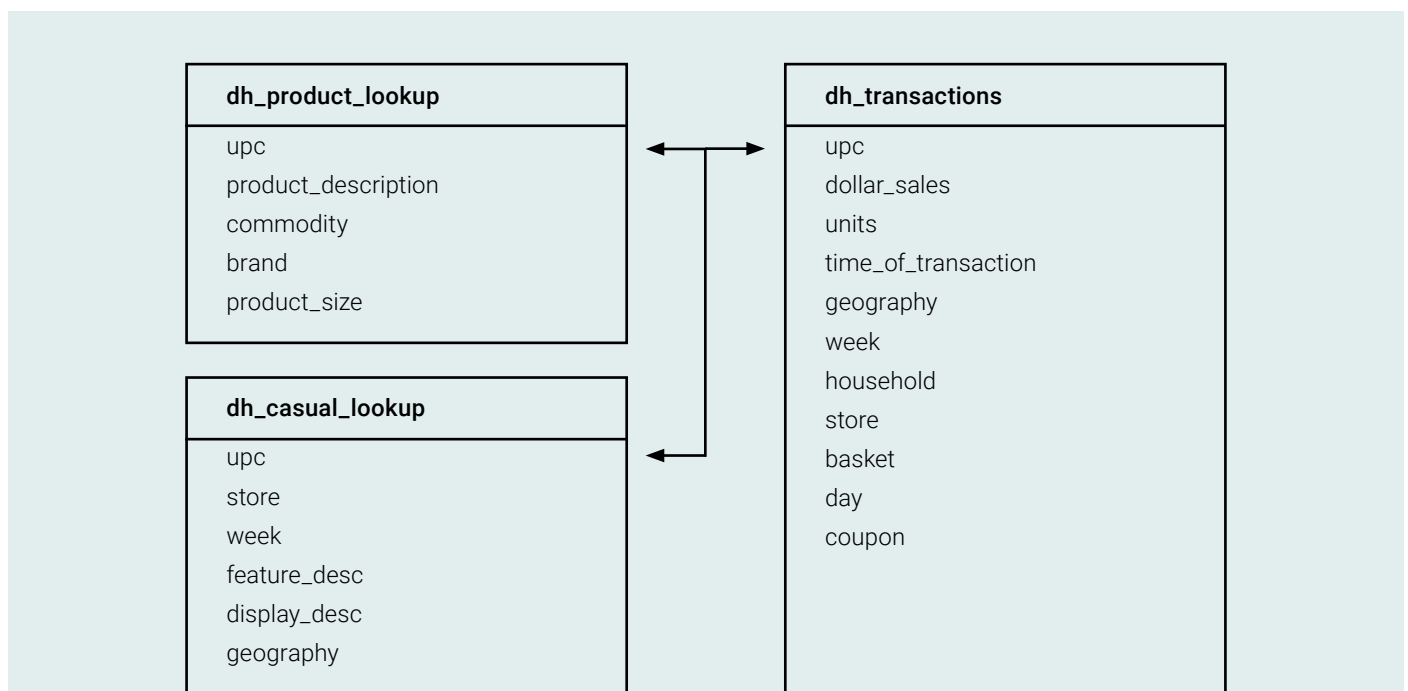

The dataset has successfully been used in classroom projects and case studies and is ideally suited for this use. It allows students to interact with real-world data and search for their own insights. The richness of this data and the potential analyses it enables makes it a valuable teaching tool.

It also provides students with the opportunity to understand the process required to mine data. Since this is a relational database, students will need to merge multiple data tables together and aggregate data in search for insights.

The following are examples of questions that could be submitted to students from the Carbo-Loading data set:

- **What is the household penetration of Product X? That is, out of all customers purchasing Pasta Sauce, what percent purchase Product X or Brand Z?**
- **Did any customers first purchase an item or category using a coupon? If so, how many of these customers made additional purchases of the item or category?**
- **In two complementary categories (e.g. Pasta and Pasta Sauce), what products, if any, are commonly purchased together? Are there crosspromotional opportunities?**
- **What percent of category customers are loyal to a product or brand? Is there a large percent of customers who purchase similar products within the same category but do not appear to be brand loyal? If so, can the reason for switching be detected?**

## Carbo-loading: dataset details

## dh\_transactions

**Description:** This table represents 2 years of Pasta, Pasta Sauce, Syrup and Pancake Mix transactions, at a household level.

**Number of records:** 5,197,691

Variable	Description
upc	Standard 10-digit unique product code
dollar_sales	Amount of dollars spend by the consumer
units	Number of products purchased by the consumer
time_of_transaction	The time of transaction expressed in military time.
geography	Distinguishes between two large geographical regions. Possible values are 1 or 2.
week	Expresses week of the transaction. Possible values are 1 through 104. Values are assigned in a chronological order.
household	Identifies unique households.
store	Identifies unique stores.
basket	Identifies unique baskets/trips to the store.
day	Expresses day of the transaction. Possible values are 1 to 728. When 'day' has values 1 through 7, then 'week' will be 1. When 'day' has values 8 through 14, then 'week' will be 2, etc.
coupon	Indicates coupon usage. 1 if used, 0 for no coupon.

## dh\_product\_lookup

**Description:** Provides detailed product information for each upc in 'dh\_transactions'.

**Number of records:** 927

Variable	Description
upc	Standard 10-digit unique product code
product_description	Description of product.
commodity	Specifies 1 of 4 categories: Pasta, Pasta Sauce, Pancake Mix or Syrup.
brand	Specifies brand of item.
product_size	Specifies package size of product.

## dh\_causal\_lookup

**Description:** Provides trade activity for each UPC/week. If a UPC is missing a record for a week then no trade activity occurred for that item on that week. Note that weeks 1-42 do not have any causal data.

**Number of records:** 351,372

Variable	Description
upc	Standard 10-digit unique product code.
store	Identifies unique stores.
week	Expresses the week of the transaction. Possible values are 1 through 104. The values are assigned in chronological order.
feature_desc	Describes location of product on weekly mailer.
display_desc	Describes location of temporary in-store display containing product.
geography	Distinguishes between two large geographical regions. Possible values are 1 or 2.
